

ABSTRACT

A weather guard intended to be fitted externally of a window (5) and comprising a frame (2) and a cloth (3) of fabric which coats said frame (2), said frame being intended to abut with facade surfaces (4) located adjacent the window (5) such as to form a free
5 space between the window frame and the cloth (3), and wherein the frame (2) comprises a number of frame members (20) which extend from a common securing device (6) at an apex (32) of said frame (2), wherein each frame member (20) comprises at least two tubular segments (21a-c) adapted to be joined end-to-end at a joint into a unitary frame member (20) and an elastic cord means (22) extending through the hollow lumen of
10 each of said segments (21a-c).
